I Interesting Integers

Undoubtedly you know of the Fibonacci numbers. Starting with $F_1 = 1$ and $F_2 = 1$, every next number is the sum of the two previous ones. This results in the sequence $1, 1, 2, 3, 5, 8, 13, \ldots$.

Now let us consider more generally sequences that obey the same recursion relation

$$G_i = G_{i-1} + G_{i-2} \qquad \text{for } i > 2$$

but start with two numbers $G_1 \leq G_2$ of our own choice. We shall call these Gabonacci sequences. For example, if one uses $G_1 = 1$ and $G_2 = 3$, one gets what are known as the Lucas numbers: $1, 3, 4, 7, 11, 18, 29, \ldots$. These numbers are – apart from 1 and 3 – different from the Fibonacci numbers.

WHEN MATHNET SHUT DOWN, THE OFFICERS HAD TROUBLE REINTEGRATING INTO THE REGULAR L.A.P.D.

By choosing the first two numbers appropriately, you can get any number you like to appear in the Gabonacci sequence. For example, the number n appears in the sequence that starts with 1 and $n - 1$, but that is a bit lame. It would be more fun to start with numbers that are as small as possible, would you not agree?

Input

On the first line one positive number: the number of test cases, at most 100. After that per test case:

- one line with a single integer n ($2 \leq n \leq 10^9$): the number to appear in the sequence.

Output

Per test case:

- one line with two integers a and b ($0 < a \leq b$), such that, for $G_1 = a$ and $G_2 = b$, $G_k = n$ for some k. These numbers should be the smallest possible, i.e., there should be no numbers a' and b' with the same property, for which $b' < b$, or for which $b' = b$ and $a' < a$.

Sample in- and output

Input	Output
5 89 123 1000 1573655 842831057	1 1 1 3 2 10 985 1971 2 7
